Data Flow Diagrams:

Data Flow Diagrams (DFD) for *Streamlining Ticket Assignment for Efficient Support Operations* represent how data moves through the support system in an organized way. When a user submits a ticket, the information flows into the system where it is validated and stored in a ticket database. The system then analyzes the ticket details and automatically assigns it to the most appropriate support agent based on factors such as skill set, availability, and workload. Once assigned, a notification is sent to the agent, and the ticket status is updated continuously as the issue is being resolved. After completion, the final response is communicated back to the user. This flow of data helps reduce manual intervention, improves response time, ensures proper resource utilization, and enhances overall efficiency in support operations.
